Reconstruction Steel Work - East Bay (Contract No. 04-4030)

The as-built drawings, which are contained in these CDs, are scanned from drawings of the existing structure for the convenience of the contractor and as a means to convey to the contractor the available information regarding the existing structure. It is to be understood that no claim is being made as to the accuracy or completeness of the said information and that the State of California or its officers or agents shall not be responsible for the manner in which the contractor interprets and uses this information or for the accuracy, currency or completeness of these scanned as-built drawings. The contractor shall be responsible to obtain, at the contractor's expense, any additional information that the contractor deems necessary for completely and accurately assessing the existing conditions of the structure. The contractor shall not be entitled to any compensation for any claim arising from inaccuracy or insufficiency of these as-built drawings or in anyway related to these drawings.

</table>

Within the above limitations, the relative proportions of coarse and fine aggregates for lightweight concrete shall be adjusted as ordered by the Engineer to produce lightweight concrete of the weight and strength specified.

Lightweight aggregate shall be stored in covered bins and maintained in a saturated condition for at least 18 hours prior to being placed in a mixer.

Each batch of ready-mixed concrete delivered at the job site shall be accompanied by a ticket showing volume of concrete, the weight of cement in pounds, the weight of mix water in pounds, and the total weight of all ingredients in pounds. The ticket shall also show the time of day at which the materials were batched and the reading of the revolution counter at the time the truck mixer was charging.

Preformed expansion joint filler shall conform to the requirements of AASHO Designation M153, Type I.</td></tr>
<tr><td>3</td><td>bar reinforcing steel.</td><td>170,972 ⚠1</td><td>pounds</td><td>Shall conform to the requirements of Section 28 for intermediate grade steel, except that plain bars for bar reinforcing steel trusses shall be structural grade steel with a maximum carbon content of 0.30 percent. Welding shall conform to the requirements of Section 67. Welds of bar reinforcing steel trusses shall be arc or resistance welds which shall resist without failure loads of 2,000 pounds in double shear.</td></tr>
<tr><td>4</td><td>structural carbon steel.</td><td>854,118 ⚠1</td><td>pounds</td><td>Shall conform to the requirements of Section 31 and 67 and shall consist of furnishing and installing all new structural and miscellaneous steel, except materials specifically provided under Bid Items 5, 6, 7, 8, 9, 12, 14, and 15, complete in place as shown on the plans and as specified. Measurement shall be by the pound, scale weight, including welds and galvanizing.

All steel shapes, plates, and bars to be furnished [illegible] under this item shall conform to the requirements of [illegible] Designation: A7.

Where existing concrete is to be removed and replaced [illegible] dry-pack, as shown on the plans for the installation [illegible] brackets, such concrete removal, including [illegible] dry-pack work will not be measured for payment [illegible] sation therefor shall be included in the unit price [illegible] this item.

Expansion dam assemblies and expansion gratings [illegible] dip galvanized after fabrication.

Welded studs shall be full base threaded studs, as [illegible] by Nelson Stud Welding Division, Gregory Industries [illegible] shall be furnished and installed as shown on the [illegible] specified, and shall be measured and paid for [illegible] item.</td></tr>
</table>

GENERAL NOTES - ALL WORK

[illegible] specifications refer to the [illegible] Sections as prepared [illegible]

[illegible] construction, and other in- [illegible] will be made available [illegible] to those interested.

[illegible] and elevations of existing struc- [illegible] from original construction [illegible] of typical conditions; [illegible] to be anticipated. Where [illegible], the Contractor shall verify [illegible] conditions and dimensions, [illegible] details of work to be sub- [illegible] Engineer.

[illegible] designated to be removed and relocated, [illegible] stored shall be removed with all reason- [illegible] cleaned of all foreign material, ready [illegible] Materials to be stored shall be transported to and stored in the Division's Storage Yard on the East Bay Mole in locations to be designated and as directed by the Engineer. Any materials designated to be removed and re-used or stored which are unnecessarily damaged by the Contractor or by others while under his control, shall either be repaired to the Engineer's satisfaction or shall be replaced in kind at the Contractor's expense.

Materials designated to be stored shall be segregated according to size, type, shape or other category and shall be properly identified by tag, stencil mark, or other means approved by the Engineer. All bolts shall be stored with washers on and nuts run down.

5. The removal and disposal of materials not re-used or stored shall comply with the requirements of Section 10 and the following modifications.

Except as otherwise specifically provided, materials removed and not reinstalled shall become the property of the Contractor and shall be disposed of by him outside of the contract limits and full compensation therefor shall be included in the unit and lump sum prices paid for the various bid items requiring such work.

Removed concrete shall be broken into pieces not larger than three feet in greatest dimension, reinforcing steel projecting therefrom cut off flush, and the concrete shall be dumped and spread evenly in locations designated by the Engineer on the East Bay Mole.

NEW AND STATE-FURNISHED MATERIALS

6. Full compensation for furnishing and installing any new materials and doing all the work required to adapt new or State-furnished materials to locations shown on the plans shall be included in the prices paid for the various items of work. Wherever suitable State-furnished materials are not available, the Contractor shall provide new materials as required in accordance with the specifications.

⚠1 [illegible] See Contract Change Order No 8

7. All portland cement concrete shall be Class L, shall conform to the requirements of Sections 26 and 27 and [illegible] compressive strength of 3,000 psi [illegible] weight of 105 pounds per cubic [illegible] of 28 days.

[illegible] dry-pack grout shall conform to the [illegible] requirements of Sections 26 and 27 and shall [illegible] by volume of Type II portland cement [illegible] sand with only enough water to [illegible] All grout shall have a com- [illegible] of 3,000 psi at the end of 28 days and [illegible] finish the adjacent concrete [illegible]

[illegible] grout and dry pack grout as shown [illegible] specified will not be measured, but [illegible] shall be included in the [illegible] items of work and no addi- [illegible] made therefor.

[illegible] for bonding new concrete or grout to [illegible] between joists and deck, sur- [illegible] concrete shall be roughened by wet [illegible] to a minimum depth of 1/2-inch [illegible] flushed with a high pressure

CONCRETE AND GROUT (Cont'd)

air-water jet so that a clean surface of sound concrete is exposed. Preparation for bonding new dry-pack grout to the deck concrete shall consist of wire brushing and such other cleaning of the existing concrete surface as is required to provide a clean surface of sound concrete. The surfaces so exposed shall be kept continuously wet for not less than 24 hours before placing new concrete or grout and, at the time of placing, shall be clean and slightly damp. Holes drilled for grouting shall be treated in the same manner as provided for surfaces receiving grout or new concrete except that cleaning shall be performed by high pressure air-water jet, and shall be free of all foreign and loose material at the time of grouting. Areas to receive epoxy resin adhesive shall be allowed to dry.

EPOXY ADHESIVE AND MORTAR

10. An epoxy-thiokol adhesive coating to bond new concrete or grout to old concrete shall be applied to prepared surfaces of existing concrete as a brushed coating not less than 1/16-inch thick in areas where the finished surface is to be less than two inches above the surface of existing concrete, and shall be followed by placement of grout or concrete of 1-1/2 inch maximum slump at such times and in such a manner as to secure the most effective bond between new concrete or grout and old concrete.

Mixing and application of all epoxy-thiokol adhesive coating shall be personally supervised by a qualified technical representative of the formulator. The procedures and materials to be used and the qualifications of the technical representative shall be subject to the approval of the Engineer and no adhesive coating shall be placed until such approval has been granted.

Epoxy-thiokol adhesive coating shall be prepared as follows:

Description	Composition by Weight	
	Each	Combined Mix
Can A		
Shell Epon Resin 815, or equal	100%	60.7%
Can B		
Thiokol LP-3, or equal	80%	26.6%
DMP-30, or equal	20%	6.7%
	100%	100.0%

Into the combined mix of Cans A and B, add Murter White Silica, or equal, to produce the proper consistency for application as an adhesive coating. No epoxy-thiokol adhesive shall be applied when either the ambient or concrete temperature is lower than 60° F.

Epoxy-thiokol adhesive coating which sets up in the opinion of the formulator's representative or the Engineer before the concrete or grout is placed shall be removed by methods approved by the Engineer and fresh epoxy-thiokol adhesive coating shall be applied before the concrete or grout placed as shown on the plans and as specified: such work will not be measured but full compensation therefor shall be considered to be included in the unit price paid for removing concrete.

Should application of heat be required to complete the cure of the epoxy-thiokol adhesive coating, the heat shall be distributed evenly in such a manner that the temperature rise and fall of the concrete shall not exceed 20° F. per hour. Full compensation for application of heat required to complete the cure of epoxy-thiokol adhesive shall be included in the unit price paid for concrete removal.

Full compensation for furnishing and applying the required epoxy-thiokol adhesive coating shall be included in the price paid for concrete removal, and no additional allowance will be made therefor.

STEEL WORK

11. Where removing or removing and reinstalling existing structural steel is required to perform the work of this contract and such work is not specifically provided in the bid item descriptions, such removing or removing and reinstalling shall be performed by the Contractor as shown on the plans and as specified and will not be measured but full compensation therefor shall be considered to be included in the unit or lump sum prices paid for the bid items for which such removing or removing and reinstalling is required.

STEEL WORK (Cont'd)

12. Dimensions, weights and properties of rolled steel structural shapes shall match those set forth in the Steel Construction Manual of the American Institute of Steel Construction.

13. Welded steel members shall be fabricated to the dimensional tolerances set forth in the Standard Specifications for Welded Highway and Railway Bridges of the American Welding Society.

14. The Contractor shall provide a sufficient quantity of identified samples of A440, A441 and T-1 steel ordered under this contract to perform the tests required for qualification of welders, welding operators, and welding procedures. Such samples will not be measured but full compensation for furnishing and testing such samples shall be included in the unit prices paid for the structural steel bid items and no additional compensation will be allowed therefor.

15. High strength bearing bolts with their nuts and hardened washers shall be furnished and installed in accordance with the requirements of Section 31 except that nuts shall be tightened by the calibrated wrench method. High strength bearing bolts shall be of the interference-body type as manufactured by Lamson and Sessions.

All high strength bearing bolts with their nuts and hardened washers will be measured and paid for under Bid Item 4.

16. Heads of bolts installed on longitudinal members shall face the center line of the lower deck, and on transverse members shall face the traffic flow of the completed bridge.

ELECTRICAL AND MECHANICAL WORK

17. Electrical and mechanical work shall conform to the requirements of Sections 60 and 62, and the following modifications.

Full compensation for galvanizing required for electrical and mechanical work shall be considered as included in the unit prices paid for the various items of work.

Cleaning and painting of electrical and mechanical work shall conform to the requirements of Sections 32, 33, 60, and 62, except that full compensation therefor shall be included in the lump sum price paid for cleaning and painting.

18. All ferrous fastenings and supports shall be hot-dip galvanized. The Contractor shall furnish and install all fastenings and supports required to provide pipe and conduit complete in place and in operable condition and full compensation therefor shall be included in the prices paid for the various items of work.

The interior of each conduit shall be clean before installation of cable or wire, and full compensation for required cleaning shall be considered as included in the price paid per linear foot for the cable or wire to be installed.

19. The Contractor shall furnish and install an approved insulating material between dissimilar metals to prevent galvanic action.

20. Full compensation for all additional labor and materials not shown on the plans or called for herein and for furnishing and installing materials shown on the plans but not covered under specific bid items, but which are necessary to provide the electrical and mechanical work complete and in satisfactory operating condition shall be considered as included in the prices paid for the electrical and mechanical work or units thereof and no additional compensation will be allowed therefor. The use of State-furnished materials does not relieve the Contractor of his responsibility to provide the electrical and mechanical systems complete and in satisfactory operating condition.

21. All new materials and equipment in electrical and mechanical work furnished by the Contractor shall match existing materials in the project.

22. Existing electrical and mechanical systems and other utilities shall be maintained in operable condition equivalent in the opinion of the Engineer to that existing at the time construction is begun, and full compensation for such maintenance including the installation and removal of temporary facilities required to provide uninterrupted services shall be considered as included in the prices paid for the various contract items of work and no additional payment will be allowed therefor.

PROJECTS ENGINEER—LICENSE 1470

DATE APPROVED October 6, 1961

USE OF STATE-OWNED TRAVELER SCAFFOLDS

23. Two State-owned traveler scaffolds, No's. BB4 and BB5 on the east bay spans and two State-owned traveler scaffolds, No's. BT1 and BT2, on the west bay spans are available for use by the Contractor at his option subject to the following requirements.

a. Not less than two State-owned traveler scaffolds shall be available at all times for use by bridge maintenance forces on the east bay spans.

b. Prior to any use by the Contractor of State-owned scaffolds BB4 and BB5, the installation of air, electric, water, and control systems under Bid Item 9 shall be completed.

c. Whenever the Contractor in the progress of his work meets a scaffold used by the maintenance forces, he shall trade it for the last of his train, transfer materials and equipment from one to the other, and put both scaffolds into the condition suitable for the changed occupancy and use. The transfer shall be accomplished with the least possible interference with maintenance operations.

d. The State will furnish the Contractor extension beams, hangers, and accessories required in moving the scaffolds across expansion joints. This material shall be returned to the State in good condition immediately following each use.

e. The State-owned traveler scaffolds and the traveler rail system were designed to be used for maintenance purposes. Their capacities for performing the work of this contract safely without adaptation are limited. Therefore, it shall be the Contractor's responsibility to determine the capacities of the State-owned traveler scaffolds No's. BB4, BB5, BT1, and BT2 and the existing and altered traveler rail system and to design and construct any additional alterations required thereon to insure their safety under any loads that may be imposed upon them, to construct any other structural, mechanical, electrical, or other alteration required in the performance of the contract work, and to repair and maintain the scaffolds in operable condition during the contract period. Upon completion of the work, the traveler scaffolds shall remain in place on the east bay spans at locations designated by the Engineer and the Contractor shall restore the traveler scaffolds and traveler rail system to a condition suitable for maintenance use as approved by the Engineer. Furnishing all materials and doing all work required to move and adapt the scaffolds and adapt the traveler rail system as required in this note and which are not provided under Bid Items 8 and 9 will not be measured but will be considered to be for the Contractor's convenience and full compensation therefor will be considered to be included in the unit and lump sum prices paid for the various items of work.

TRAVELER SCAFFOLD AND RAIL SYSTEM MODIFICATIONS

24. Detailed plans of modifications of State-owned traveler scaffolds and of the traveler rail system and construction details of all other scaffolds which will be used by the Contractor, together with proposed loadings and procedures of use, shall be submitted to the Engineer for approval.

NO.	BID ITEM	QUAN.	UNIT
5	high strength structural steel.	5,705,906 ⚠1	pounds

DESCRIPTION

Shall conform to the applicable requirements of Section 31 and shall consist of furnishing and installing all steel designated on the plans to be A440 steel or A441 steel, complete in place as shown on the plans and as specified.

Steel designated on the plans as A441 steel shall be a high strength low alloy steel conforming to the requirements of ASTM Designation: A441.

Steel designated on the plans as A440 steel shall be a high strength structural steel conforming to the requirements of ASTM Designation: A440 as modified herein. For material 1/2-inch and under in thickness and all rolled sections with webs 1/2-inch and under in thickness, the maximum carbon content shall be 0.23 percent (ladle analysis) and the minimum yield strength shall be 45,000 psi; all other requirements of ASTM Designation: A440 shall apply. A440 steel plates over 1/2-inch in thickness shall conform to all requirements of ASTM Designation: A440.

Welding of high strength structural steel shall conform to the requirements of Section 67, Chapter I; Section 67, Chapter III articles (b), (h), (i); and the following modifications.

In lieu of the requirements of the indicated provisions of the Standard Specifications for Welded Highway and Railway Bridges of the American Welding Society the following shall apply.

Appendix D, paragraph D105(a).--Not less than one test weld shall be made for each procedure and position in each thickness of material to be welded in construction.

Appendix D, Table D-1.--

Actual Thickness to be Welded in Construction	Test Plate Thickness	Number and Type of Tests Required: Reduced-Section Tension (See Fig. D-6)	Free Bend (See Fig. D-7)	Root Bend (See Fig. D-8)	Face Bend (See Fig. D-8)	Side Bend (See Fig. D-9)
3/8-inch	3/8-inch	2	2	2	2	--
Over 3/8-inch	Actual Thickness	2	2	--	--	4

Appendix D, Fig. D-10.--Order of Removal of Test Specimens from Welded Test Plate (for Plate Over 3/8-inch Thick)

Appendix D, paragraph D109(a).--The tensile strength shall not be less than the following.

Thicknesses 3/4-inch and under
ultimate strength . . . 70,000 psi min.
Thicknesses over 3/4-inch to 1-1/2 inch inclusive
ultimate strength . . . 67,000 psi min.

In lieu of the number of sample joints (test welds) required for qualification of welding procedures set forth in Test Method No. Calif. 601-C, Part II, paragraph B.3.a., not less than one sample joint (test weld) shall be made for each procedure and position in each thickness of material to be welded in construction.

Physical property requirements for the mechanical properties of weld metal test set forth in Test Method No. Calif. 601-C, Part II, are as follows.

free bend specimens . . . 25% min. elongation
round tensile specimen . . . 70,000 psi min. tensile str.
. . . 25% min. elongation
. . . 50% min. reduction in area.
side bend specimens . . . pass

NO.	BID ITEM	QUAN.	UNIT
6	structural steel, T-1.	422,667 ⚠1	pounds

Shall conform to the applicable requirements of Section 31 and shall consist of furnishing and installing all steel designated on the plans to be T-1 steel including stressing and all other work required to provide the T-1 steel complete in place as shown on the plans and as specified.

T-1 steel shall be a heat-treated, constructional alloy steel of firebox quality as manufactured by the United States Steel Corporation, or equal, conforming to the following provisions.

T-1 steel shall conform in all respects to the requirements of Section 63, paragraph (b)(1). Testing of T-1 steel shall conform to the requirements of Section 63, paragraph (b)(4).

Welding of T-1 steel shall conform to the requirements of Section 67, Chapter I; Section 67, Chapter III, articles (c), (h), and (i); and the following modifications.

In the qualification of welders, welding operators, and welding procedures, the standard guided-bend test jig of the American Welding Society shall be modified to use a 1-1/4 inch radius mandrel instead of a 3/4-inch radius mandrel.

In lieu of the requirements of the indicated provisions of the Standard Specifications for Welded Highway and Railway Bridges of the American Welding Society the following shall apply.

Appendix D, paragraph D105.(a).--Not less than one test weld shall be made for each procedure and position in each thickness of material to be welded in construction.

Appendix D, Table D-1.--

Actual Thickness to be Welded in Construction	Test Plate Thickness	Number and Type of Tests Required: Reduced-Section Tension (See Fig. D-6)	Free Bend (See Fig. D-7)	Root Bend (See Fig. D-8)	Face Bend (See Fig. D-8)	Side Bend (See Fig. D-9)
3/8-inch	3/8-inch	2	2	2	2	--
Over 3/8-inch	Actual Thickness	2	2	--	--	4

Appendix D, Fig. D-10.--Order of Removal of Test Specimens from Welded Test Plate (for Plate Over 3/8-inch Thick)

Appendix D, paragraph D109(a).--Tensile strength shall not be less than 115,000 psi.

Appendix D, paragraph D109(b).--The elongation shall not be less than 18 percent.

In lieu of the number of sample joints (test welds) required for qualification of welding procedures set forth in Test Method No. Calif. 601-C, Part II, paragraph B.3.a., not less than one sample joint (test weld) shall be made for each procedure and position in each thickness of material to be welded in construction.

Physical property requirements for the mechanical properties of weld metal test set forth in Test Method No. Calif. 601-C, Part II, are as follows.

free bend specimens . . . 16% min. elongation
round tensile specimen . . . 115,000 psi min. tensile str.
. . . 16% min. elongation
. . . 50% min. reduction in area.
side bend specimens . . . pass

The State will furnish two stressing devices as shown on the plans for the Contractor's use during stressing operations. The stressing devices are available at the Division's office, 151 Fremont Street, San Francisco.

The Contractor will be required to furnish grip seats and rods and such other items as may be required for his operations. All Contractor-furnished items will be considered as being furnished for the Contractor's convenience, shall be approved by the Engineer and shall remain the property of the Contractor.

The State-furnished stressing devices shall be adapted as required during the course of the work, maintained in working condition at all times and stored on completion of the work.

The Contractor shall conduct tests, to be witnessed by the Engineer, to demonstrate that the jacks are capable of rated operation and that the State-furnished stressing devices are each capable of developing a tension of 400,000 pounds in actual use. Gages shall be re-calibrated and calibration curves shall be delivered to the Engineer before the devices are used.

The T-1 steel cover plates shall be stressed within a tolerance of plus five percent to minus zero percent of the initial prestress force specified on the plans.

T-1 steel cover plates that cannot be drawn tight to the existing flange by tightening the high strength bearing bolts (due to the presence of burrs, trapped drilling refuse or other obstruction) shall be separated from the flange and the interfaces cleaned of all obstructing material. After cleaning of the interfaces, the plates shall be retensioned and rebolted.

Red lead paste shall consist of red lead and linseed oil conforming to the requirements of Section 32 thoroughly ground together to form a paste of such consistency that it can be molded without crumbling but will not flow. Where application of red lead paste is indicated on the plans or required by the Engineer, voids shall be completely filled with red lead paste and such red lead paste will not be measured but full compensation for furnishing and placing all materials and doing all work required therefor shall be included in the unit price paid for T-1 steel under this bid item.

NO.	BID ITEM	QUAN.	UNIT	DESCRIPTION
7	steel curb alterations.	3,283.78 ⚠1	linear feet	Shall conform to the requirements of Section 31 and shall consist of removing, altering, and reinstalling steel curb, including making all connections, plugging holes and furnishing and installing all plates, shapes, anchor bolts and other fastenings, and all other new materials required and doing all work required to provide the reinstalled steel curb complete in place as shown on the plans and as specified. Steel curb materials not reinstalled shall be removed and stored. New structural steel shall conform to the requirements of ASTM Designation: A7. New raised pattern floor plates, if required, shall be United States Steel Pattern M-1 or Central Knobby as required to match existing. Measurement shall be by the linear foot along the face of the curb after reinstallation.
8	Remodeling and adjusting traveler rails.		LUMP SUM	Shall conform to the requirements of Section 31 and shall consist of: removing, altering, and reinstalling traveler rail connections and hangers; furnishing and installing bent plates, shims, clamps, clip angles, rods, and all other new materials required; making all adjustments of the traveler rail system required to perform the work; and, upon completion of the work, providing the rails aligned and set to the specified grade with hanger rods adjusted to share the loads, all as shown on the plans and as specified.
9	altering traveler scaffolds.	2	each	Shall consist of altering the State-owned traveler scaffolds as required to furnish and install the air, electrical, water and control systems and all other new materials required to provide the scaffolds complete and in operating condition as shown on the plans and as specified. All miscellaneous materials, parts, and equipment shall match corresponding materials, parts, and equipment on the West Bay upper deck scaffolds.
10	Cleaning and painting.		LUMP SUM	

Shall conform to the requirements of Sections 32 and 33 and shall consist of: all cleaning required to prepare surfaces for paint; to prepare surfaces for embedment in concrete or grout; and to prepare contact surfaces between existing members, T-1 steel cover plates, and of fill plates incidental to the T-1 steel cover plates; and all painting required in the work of this contract; all as shown on the plans and as specified.

STEEL CLEANING AND PAINTING SCHEDULE

Description of Surface	Cleaning and Painting Systems Required
existing, reinstalled, or ungalvanized new, metal surfaces to be embedded in concrete or grout	I-a
contact surfaces not designated to receive red lead paste between T-1 steel cover plates, existing members, and of fill plates incidental to the T-1 steel cover plates	I-a
existing painted steel surfaces designated to receive red lead paste	II-a
T-1 steel contact surfaces designated to receive red lead paste	I-b
new galvanized surfaces to be embedded in concrete	II-a
new galvanized surfaces not to be embedded in concrete	II-c
existing steel paint surfaces damaged by construction operations	I-c
existing painted or bare surfaces exposed by removal of materials	I-c
interior surfaces of luminaire poles to be reinstalled	I-c
exposed surfaces of all new and reinstalled steel not covered in the above descriptions	I-d

Cleaning systems designated in the steel cleaning and painting schedule are: I, sandblast cleaning; II, steam cleaning.

Painting systems designated in the steel cleaning and painting schedule are as follows.

a. No paint, except that steel to be embedded in concrete or grout and which will be exposed more than 48 hours between sandblast cleaning and placement of concrete or grout shall be protected by one coat of G-52. In no case shall such time of exposure exceed 14 days.

b. One coat G-52, and not less than two coats G-53.

c. One coat G-52, not less than two coats G-53, and one coat G-80.

d. Before erection; one coat G-52, one coat G-53, additional coats G-53 as required to provide a maximum elapsed time between coats of G-53 of six weeks and: after erection; one spot coat G-53, one full coat G-53, and one coat G-80.

Paints designated under painting systems, above, are as follows.

G-52 is pretreatment vinyl wash primer, State Specification 52-G-52.

G-53 is paint, primer, red lead, semi-quick drying, State Specification 58-G-53.

G-80 is aluminum paint finish coat, State Specification 54-G-80.

Pipe interiors and cast iron need not be sandblast cleaned or painted except that conduit shall conform to the requirements of Section 60.

Where sandblast cleaning of contact surfaces between existing members, T-1 steel cover plates, and of fill plates incidental to the cover plates is required, such sandblast cleaning shall be performed not more than 48 hours before fit-up.

Paint, if sprayed on, shall be brushed out around rivet and bolt heads and exposed edges to avoid bridging over crevices and re-entrant corners and to ensure even paint coats of the specified thickness.

Lower deck luminaires to be relocated and their ballasts shall not be painted except as required to touch up damaged paint.

NO.	BID ITEM	QUAN.	UNIT	DESCRIPTION
11	removing steel deck drains.	20,490 ⚠1	pounds	Shall consist of removing six and eight inch diameter steel drain pipe, together with drain outlets, flanges, fittings, and all materials incidental thereto as shown on the plans and as specified. All metallic materials removed and not reinstalled under Bid Item 12 shall be stored. Measurement shall be by the pound, scale weight, of metallic materials removed except that computed weights may be used where expressly permitted by the Engineer.
12	installing steel deck drains.	10,193 ⚠1	pounds	Shall consist of modifying and reinstalling State-furnished six and eight inch diameter steel drain pipe, drain outlets, flanges, fittings, and materials incidental thereto, together with furnishing and installing new asbestos gaskets and any new pipe, fittings, flanges, or other new materials required to provide the steel deck drains complete in place as shown on the plans and as specified. All pipe gaskets shall be new asbestos Johns Manville No. 60, or equal. All other new materials shall conform to the requirements of Section 31. Measurement shall be by the pound, scale weight, of metallic materials installed, including new and State-furnished, as shown on the plans and as specified except that computed weights may be used where expressly permitted by the Engineer.
13	removing and storing electrical materials.	14,840 ⚠1	pounds	Shall consist of removing and storing conduit, wires, cables, traffic signal heads, and junction boxes with their supports and fastenings, and all other electrical materials required to be removed and stored as shown on the plans and as specified. Measurement shall be by the pound scale weight.
14	removing, altering, and relocating upper deck pole-mounted luminaires.	24	each	Shall consist of: removing, altering, and reinstalling steel pipe handrailing; removing the existing pole-mounted luminaires together with their poles, lamps, and all other appurtenant materials; performing the required alterations; and reinstalling the luminaires, including furnishing and installing electrical and structural connections, new secondary wiring, and all other materials required to provide the reinstalled luminaires complete in place and in operating condition as shown on the plans and as specified. Removing, altering, and reinstalling steel pipe handrailing incidental to reinstalling the luminaires shall consist of removing existing handrailing, performing the required alterations and reinstalling the handrailing complete in place as shown on the plans and as specified including furnishing and installing all new materials required therefor with the following exception. The Contractor may, at his option, use State-furnished tees, flanges, and ball ornaments which are available on the East Bay Mole, subject to approval by the Engineer.
15	removing and remounting lower deck luminaires.	47	each	Shall consist of removing and temporarily relocating the lower deck sodium vapor luminaires as required to permit modifications of lower flanges of floor beams and subsequently remounting the luminaires on the modified floor beams, including furnishing and installing new secondary wiring, conduit, fastenings, fillers, and all other materials required to provide the remounted luminaires complete in place and in operating condition upon completion of the work as shown on the plans and as specified.

DESIGN NOTES

Standard Specifications for Highway Bridges of the American Association of State Highway Officials (AASHO) modified and specified as follows:

H20-S16-44

Unit weight concrete, reinforced, 120lbs/cu.ft.

Reinforced concrete, light weight, f'_c = 3000 p.s.i., f_c = 1200 p.s.i., n = 18

Reinforcing steel, structural grade, f_s = 18000 p.s.i.

High strength structural steel

A 440 modified, f_s = 24000 p.s.i., f_y = 45000 p.s.i., f_u = 70000 p.s.i. min.

A 241, ¾" and less f_s = 27000 p.s.i., f_y = 50000 p.s.i., f_u = 70000 p.s.i.; over ¾" f_s = 24000 psi, f_y = 46000 psi, f_u = 67000 p.s.i.

T1, f_s = 45000 p.s.i., f_y = 100000 p.s.i., f_u = 115000 p.s.i.

High strength bearing bolts: Specifications for Structural Joints using ASTM A325 Bolts approved by the Research Council on Riveted and Bolted Structural Joints of the Engineering Foundation, March 1960

The loading capacity of the stringers will be increased by bolting understringers to the bottom flange of the stringers.

The loading capacity of the floor beams will be increased:

(1) By bolting prestressed high strength steel cover plates to the bottom flange:

(a) The addition of metal will reduce the tensile stresses of the existing material under live load.

(b) By pretensioning the new cover plate an initial compressive force will be exerted on the bottom flange resulting in a reduction of the dead load tensile stresses. A greater portion of the working stresses of the existing material will thus be available for the live load.

(2) By bolting shear brackets to both ends of the top (compression) flange, bearing laterally against the concrete deck, a partial composite action of steel and concrete will be obtained, thus, reducing the live load stresses in the top flange.

The loading capacity of the joists will be increased by addition of new joists.

SECTION A-A
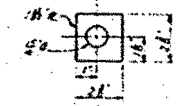
Scale 3" = 1'-0"



DETAIL B
Scale 3" = 1'-0"

SUGGESTED ERECTION PROCEDURE FOR FLOOR BEAM COVER PLATES

1. Lower traveler rails to clear plate.
2. Drill flange holes at fixed end through template.
3. Clean contact areas of flange angles as specified.
4. Coat specified contact area of cover plate with red lead paste.
5. Erect cover plate, bolt fixed end to floor beam flange
6. Erect stressing device (see Sheet No. 39)
7. Stress cover plate by jacking in increments, allowing time for inspection after each increment. Lock jacks when the specified initial prestress is reached (see Sheets No 6-15)

   Note: Prestress tolerances: +5%, no understress.
8. While plate is held under full prestress drill holes in floor beam flange, using accessible holes of plate as template. Install H.S. bearing bolts.

   Note: If plates cannot be bolted tight due to presence of burrs or trapped drilling refuse, remove bolts, release jacks, separate plate from flange, clean contact surfaces, retension and rebolt.
9. Remove stressing device, drill flange holes thru remaining plate holes and install remaining bolts.

EXPANSION DAM TRUSSES (For 288' and 504' spans)

ERECTION PROCEDURE

A Understringers:
1 Drill first eight flange holes at each end of existing stringers and bolt understringers through these holes before drilling and bolting remaining holes.
2 Rolled understringers shall be placed with the natural camber upward.
3 ⅞ inch diameter H.S. bearing bolts in 15/16 inch diameter holes shall be used for all field connections.

B Additional Joists
1 Clean underside of concrete deck as specified.
2 Erect joist. In lieu of using one center splice, as shown, the Contractor may erect joists either in one piece or with two splices of [illegible] and in locations approved by the Engineer. In any event one splice will be used for computing pay weights.
3 Place shims on stringers of such thickness that the gap between concrete and joist will average about ¾ inches, with a maximum of one inch and a minimum of ½ inch. Drill holes in top flange of stringer, place ⅞ ϕ H.S. bearing bolts (Detail K), install studs and shims at curb [illegible].
4 Preload joist against the deck with 500 lbs at each and all points shown on Section C-C by wedging, jacking or screwing as approved by the Engineer.
5 After keeping the contact areas of the concrete wet as specified fill the gap with air blown mortar continuously and tightly.
6 When the mortar has attained a strength of not less than [illegible] remove preload [illegible] nuts at curb [illegible].

C Expansion Dam Trusses
1 All welded connections shall be ¼ inch all around fillet welds.
2 All connections to existing expansion dams shall be ¾ inch full base, threaded studs (Nelson HF or equal).

ERECTION PROCEDURE OF SHEAR BRACKETS

The purpose of these brackets is to put the concrete deck into compression while the floor beam is subjected to bending and thereby to reduce compressive stresses in the floor beam flange. To achieve this it is necessary to install the brackets in such a way that they will become rigid, non-slipping, non-yielding connections between the floor beam flanges and the concrete slab.

1 The installation of the prestressed cover plate shall precede the bracket installation at each floor beam.
2 Sawcut and remove concrete, clean exposed concrete and steel surfaces as specified, fill tightly with dry pack grout.
3 Remove rivets and bolts as noted, plug unused holes by welding (carbon steel only) or with machine bolts.
4 Prepare steel contact surfaces as specified.
5 Place shear brackets, singly or in pairs, fasten loosely by bolting thru available holes.
6 After dry pack has reached full specified strength, press shear bracket tightly against curb toe angle with the help of wedges inserted between the tail end of the brackets and the truss post.
7 When full contact over the entire width of the bracket is obtained drill or ream holes in bracket and/or floor beam flange and install H.S bearing bolts.

NOTES

1 All field connections of brackets 1⅛" ϕ H.S. Bearing Bolts except as noted.
2 For shear brackets on girder span floor beams see Sheet Nº 35.
3 For arrangement of shear brackets at U35, YB1-E1 and U8, E10-E11, see Sheet 30.
4 Where curb remains in place, brackets are similar to those shown for E11 to E23.
5 For location of deck drains and interior expansion joints, see Sheets Nº 6 to 15.
6 Location and dimensions of shims to be determined in the field.
7 For as built record of shear brackets see shop drawings. Field cutting was required for an undeterminate number of shear brackets: this has not been recorded.

LIST OF PARTS

Item	Number
Plate grip complete with accessories	[illegible]
Flange grip complete with accessories	[illegible]
Flange grip C-clamp, assembled	[illegible]
Hand operated hydraulic pump	[illegible]
100 ton hydraulic jack	[illegible]
Rod centering sleeve	[illegible]
Air operated hydraulic pump complete with pressure gage, ¼" hydraulic hose and fittings	[illegible]
Howlett wedge grip lock nut complete with spreader	[illegible]
Howlett wedge grip nut	[illegible]
Wedge grip spreader	[illegible]
[illegible] stress rod	[illegible]
[illegible] stress rod	[illegible]
[illegible] stress rod	[illegible]

These parts will be available at Division headquarters

ERECTION PROCEDURE OF STRESSING DEVICE

Clean grip area on flange angles.

Place flange grip castings on flange angles, bolt them together [illegible] Howlett wedge grip teeth into flange angles with the help of flange grip C-clamps. Place plate grip [illegible] plate with gripping pins engaged in first 14 plate holes for type A plates and first 12 plate holes for type B plates. Supporting [illegible] shall rest on flange angles. Place stressing rods, jacks and Howlett wedge grip nuts and locking nuts. Connect jacks with pump [illegible] manifold. Jacks may be placed either at the plate grip end or at the flange grip end of the stressing rod.
